

## Ohani And The Game

One day Ohani and her friend was playing a game. The rules of the game is given below:

1. Ohani Starts the game. Then the two player take turns.
2. At the starting of the game, Ohani and her friend together choose a number  $N$ .
3. They take the absolute value of  $N$ ,  $N = |N|$  or,  $N = \text{abs}(N)$ .
4. In one turn: a player chooses a divisor  $X$  of  $N$  where  $1 < X \leq N$ . Then he/she divides  $N$  by  $X$ . Then next player continues to do step 4 until  $N$  is not equal to 1.
5. The game ends when  $N$  becomes 1.
6. The player who can't make his/her next move, loses the game. Both the player plays optimally.

Ohani and her friend was playing the game for a long time. So, they got bored. Then suddenly one interesting idea came to Ohani's mind. She wants to know how many ways are there to get 1 from  $N$  such that no two way has a common number except 1 and  $N$ ?

For explanation:

Suppose  $N = 20$ .

Two possible way to get 1 is:  $20 \rightarrow 10 \rightarrow 5 \rightarrow 1$  and  $20 \rightarrow 5 \rightarrow 1$ , both the way has number 5 in common.

But:  $20 \rightarrow 10 \rightarrow 1$  and  $20 \rightarrow 4 \rightarrow 2 \rightarrow 1$  has no number common without 20 and 1.

So, now Ohani wants to know the number of ways such that no two way has common number except 1 and  $N$ . But Ohani is very weak in coding. So, she wants you to help.

### Input:

The first line of the input contains the number of testcases  $T$  ( $\leq 100000$ ).

Each of the next  $T$  lines contains a number  $N$  ( $|N| \leq 1000000$ ).

### Output:

For each testcase, output the desired answer. If it is impossible to reach 1, just print "Impossible".

Sample Input:

```
3
1
2
3
```

Sample Output:

0  
1  
1
